

Converting from edd/dm to edm

R. Keitel, TRIUMF, Vancouver
Epics Collaboration Meeting, Argonne
16-June-2006

ISAC Radioactive Beam Facility

ISAC Control System

- 3000 Devices
- ~13000 I/O channels
 - 9000 digital
 - 3500 analog
 - 70 motors
 - ~ 90000 EPICS records
- 34 IOCs (Motorola MVME162, PC104, Pentium)
vxWorks(26), Linux(3), WindowsXP(5)
- 12 PLC systems (Modicon (11), Siemens(1), supervised by EPICS)
- 9 RF control systems (Windows98/XP, supervised by EPICS)

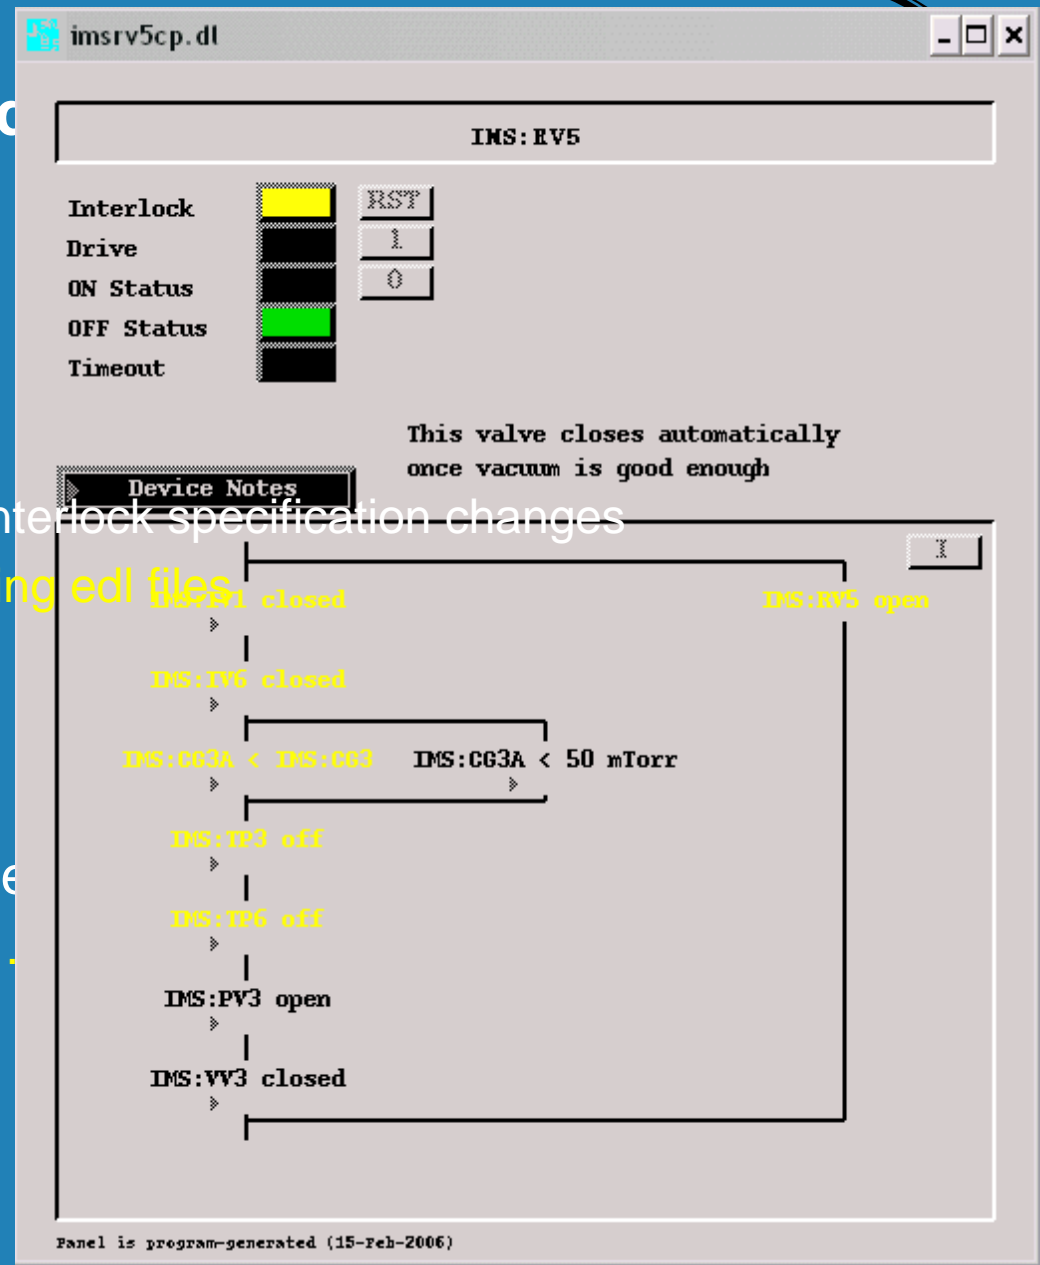

edd/dm Situation

- Started with EPICS 10 years ago
- Picked dm because of speed and small footprint
- Old, graphs,, but “did the job”
- Wanted more features, introduced bug
- No point wasting time → move forward to edm

What do

We have 2400 display files

- 1700 generated by program
- regenerated every time an interlock specification changes
 - ▶ Need tool for programming edl files
- 700 drawn and maintained
 - ▶ Need converter .adl → .

Color Rule Modify

First look at edm

Color Rule Modify

name	fill	channel	comparator	value	connector	color
if	\$(A):STATMO		greater than	0	use	
if	\$(A):STATON		greater than	0	and	
if	\$(A):STATOFF		greater than	0	use	
if	\$(A):STATINT		equals	0	use	
if	\$(A):STATON		greater than	0	use	
if	\$(A):STATDRV		greater than	0	and	
if	\$(A):STATON		equals	0	use	
if	\$(A):STATOFF		greater than	0	use	
if			less than		use	
if			less than		use	
if			less than		use	
if			less than		use	
if			less than		use	
if			less than		use	
if			less than		use	
if			less than		use	

default foreground

off

on

default background

off

on

quit

First look at edm

- Potential show-stopper:
 - Colour rules
- Solution:
 - Modify edm (John Sinclair)

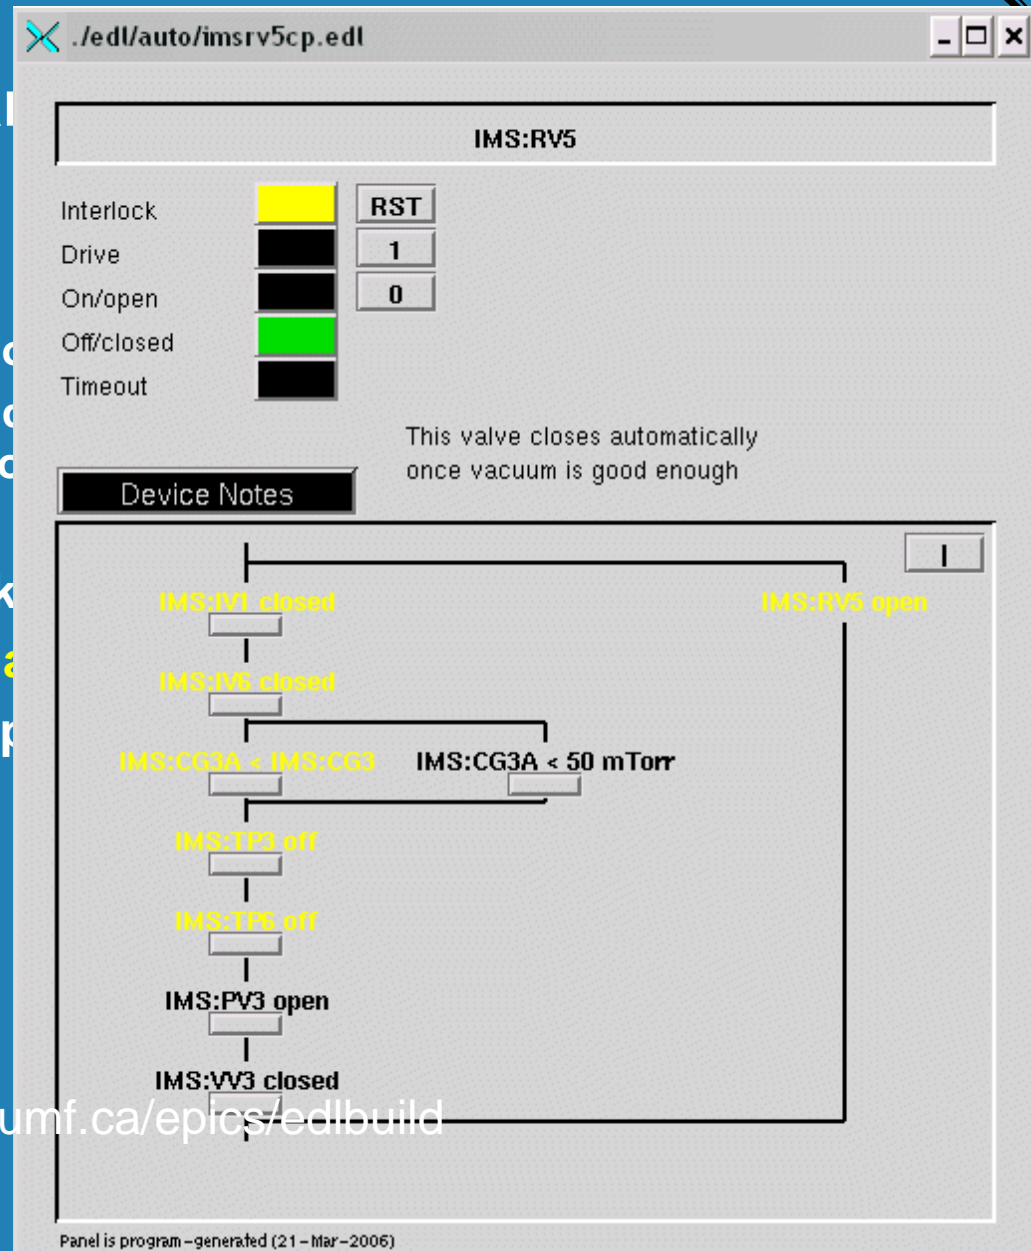

```
rule 54 fill {
= 1 : device-fill-brokenortmo
= 2 : device-fill-badinterlock
= 3 : device-fill-on
= 4 : device-fill-off
= 5 : device-fill-transition
default : value-invalid
}
```

```
# :# fill colour rule
# :# colours: 1 tmo 2 int 3 on 4 off 5 trans
# :# macros: A=$(A):STATMO B=$(A):STATON C=$(A):STATOFF D=$(A):STATINT E=$(A):STATDRV
fi fill
A?:@$(A):STATMO,$(A):STATON,$(A):STATOFF,$(A):STATINT,$(A):STATDRV
A?1:(B&&C?1:(D=0?2:(B?3:(E&&(!B)?5:(C?4:4))))))
```

Program

- Perl module library
 - Edl.pm - main code module
 - EdlRectangle.pm - widget-specific code
 -
- syntax similar to Perl/Tk
- allows configuration of a program
- easy to configure site-specific programs
- extensible

<http://isacwserv.triumf.ca/epics/edlbuild>

EdlBuild example

```
#!/usr/bin/perl -w

use strict;

# environment variable EDLBUILD
use lib $ENV{EDLBUILD};

use Edl;|

my $panel = new Edl('test.edl');

$panel->rectangle(x => 10, y => 10, w => 100, h => 15, lineColor => 'index 10',
                 fill => 1, fillColor => 'index 9');
$panel->text_monitor(x => 10, y => 30, w => 100, h => 15, fgColor => 'index 22',
                   controlPv => '"ITW:IG1:RDVAC"');

$panel->configure(w => 150, h => 150);

$panel->finish();
```

.adl → .edl Conversion

- started with existing converter badfish (D. Kotturi, SLAC)
 - ✚ fought SLAC specifics (colours, colour rules ..)
 - ✚ some things were missing
 - ✚ some things wouldn't work for us
- rewrote
 - kept adl parsing – saved tons of work
 - added TRIUMF colour module
 - used EdlBuild for edl generation

>>> **tadl2edl.pl** <<<

- Included in EdlBuild tar

Conversion Experience (I)

- Plan
 - prepare operations group – tutorial sessions
 - use window of opportunity – Jan/Feb/Mar shutdown
 - after SC linac controls commissioning
- Actual
 - controls installation/commissioning for SC linac moved into shutdown
 - some chaos
 - operations group was terrific

Conversion Experience (II)

- several iterations: convert \leftrightarrow improve tadl2edl
- some things didn't convert well (i.e. we didn't make the converter smart enough)
 - bar-graphs
 - XY-plotsfixed interactively \rightarrow no more conversions
- didn't understand edm well enough
 - bad defaults in converter
 - different default behaviour between dm and edmused simple Perl filters to fix the whole screen set

Other Issues

- **dm loads “static” record info for each dl file**
 - used HOPR, LOPR for re-scaling XY-plots, bars, meters
- **edm PV factory loads only once**
 - XY-plot ok
 - used kludges with embedded windows
 - JS helped by modifying the meter widget
- **dm valuator (= slider) widgets used extensively**
 - allowed fine sliding
 - extensive TRIUMF mods
- **edm motif slider barely fits**
 - made major mods to motif slider to recreate TRIUMF functionality
 - will be repackaged as “Triumf Slider”

	<div><div>IOS:Q9</div><div><div>0</div><div>387</div><div>5000</div></div></div>	386 V	386 V
	<div><div>IOS:YCB9</div><div><div>0</div><div>80</div><div>1000</div></div></div>	80 V	300 V
	<div><div>IOS:XCB8</div><div><div>0</div><div>220</div><div>1000</div></div></div>	220 V	300 V
	<div><div>IOS:Q8</div><div><div>0</div><div>739</div><div>5000</div></div></div>	738 V	738 V
	<div><div>IOS:IV7</div><div><div>Open</div><div>Shut</div></div></div>	IOS:IG8 1.75e-07 T	IOS:IG4 2.47e-07 T
	<div><div>IOS:Q7</div><div><div>0</div><div>369.00</div><div>5000</div></div></div>	369.19 V	369.34 V

More issues

- XY-graph
 - needed dump to ASCII file → JS
 - added “clear plot” command
- Bar
 - display PV1
 - colour based on alarm state of PV2

Fix in database:

 - PV1.SDIS “PV2.SEVER MS”
 - PV1.DISV 4
- Related Display
 - added CTRL-MB3 → start web-browser with cgi script
 - small footprint dilo
 - integrate context-sensitive web-help into edm

Summary

- Conversion to edm is done
- ISAC controls runs production with edm since late March
- dm removed from last console a few weeks ago
- edm is stable
- operations is happy
- collaboration with John Sinclair was a pleasure – thanks John!
